```
package cn. csxt. test;
import java.util.Random;
/**
 * Random中常用的方法
 * @author 江
 *
 */
public class TestRandom {
         public static void main(String[] args) {
                   Random rand=new Random();
                   //随机生成【0,1)之间的double类型的数据
                   System. out. println(rand. nextDouble());
                   //随机生成int类型允许范围之内的2整形数据
                   System. out. println(rand. nextInt());
                   //随机生成【0,1)之间的float类型的数据
                   System. out. println(rand. nextFloat());
                   //随机生成false或者true
                   System. out. println(rand. nextBoolean());
                   //随机生成【0,10)之间的int类型的数据
                   System. out. println(rand. nextInt(10));
                   //随机生成【20,30)之间的int类型的数据
                   System. out. println(20+rand. nextInt(10));
                   //随机生成【20,30)之间的int类型的数据(此种方
法较为复杂)
                   System. out. println(20+(int)
(rand. nextDouble())*10);
}
```
